Problem Statement #60 - Podcast Guest Scheduling & Outline Builder

Name: Dhanush S SRN: PES1UG24AM360 Section: F

Req ID	Type	Description	Priority	Acceptance Criteria (measurable pass/fail)	Rationale
FR-001	Functional	The system shall allow a Podcast Guest to select an available interview time slot and submit structured bullet-point discussion topics together with biography links.	High	Pass: Slot is booked, a calendar invite is dispatched to Guest and Host, and the topic outline is attached to the episode board. Fail: A booking is permitted on a date the Host has marked as blocked.	Core booking and content-capture function; the entire scenario depends on it.
FR-002	Functional	The system shall allow the Show Host to publish recurring availability windows and to mark specific dates as blocked.	High	Pass: A window published for Tue 14:00-17:00 renders as selectable slots to the Guest, and a date marked blocked renders zero selectable slots. Fail: Any bookable slot is exposed on a blocked date.	Availability is the precondition for FR-001; without a source of truth no booking can be validated.
FR-003	Functional	The system shall generate a run-of-show production sheet that sequences each approved talking point with a start timestamp and a segment duration, and totals the planned episode length.	High	Pass: For 5 approved topics with assigned durations, the sheet lists 5 segments with non-overlapping ascending timestamps and a total equal to the sum of the durations. Fail: Timestamps overlap, or the stated total differs from the sum.	This is the core output the scenario promises: timestamped run-of-show episode production notes.
FR-004	Functional	The system shall allow the Show Host to approve, reject or reorder guest-submitted talking points, and to return a rejected point to the Guest with a revision comment.	Medium	Pass: A rejected talking point is absent from the generated run-of-show sheet and the Host comment is visible to the Guest against that point. Fail: A rejected point still appears on the generated sheet.	Guest submissions are unvetted; the Host must control episode content before it becomes a production document.
FR-005	Functional	The system shall send a booking confirmation to both Guest and Host on slot reservation, and a reminder notification 24 hours before the scheduled interview.	Medium	Pass: Confirmation is dispatched within 1 minute of booking, and the reminder is dispatched between 24h00m and 23h55m before the slot start; both are recorded in the dispatch log for both recipients. Fail: Either notification is missing from the dispatch log.	Guest no-shows are the primary failure mode in remote interview scheduling.
NFR-001	Nonfunctional (Performance & Security)	The show outline generator shall compile all submitted guest topics into a formatted PDF production sheet in under 1 second.	High	Pass: Benchmarking over 100 runs at simulated peak load confirms 95th-percentile compile time under 1000 ms with no degradation of transport security. Fail: 95th-percentile compile time is 1000 ms or greater.	Hosts finalise the run-of-show minutes before recording; a slow generator blocks the live production workflow.
NFR-002	Nonfunctional (Security)	The system shall restrict episode-board access to the authenticated Show Host and the specifically invited Guest, and shall transmit all submitted content over TLS 1.2 or higher.	High	Pass: 50 automated requests to an episode board without a valid session return HTTP 403 in 100% of trials, and an OWASP ZAP scan reports zero high-severity findings. Fail: Any unauthenticated read of an episode board succeeds.	Unreleased episode outlines and guest contact details are confidential pre-publication material.
